The method comprises: (a) contacting the polypeptide in the presence of a sample; and (b) detecting the amount of bound polypeptide, in which the sample can be pre-mixed with TAK1 or TAB1 polypeptide, in which the sample can be pre-mixed with TAK1 or TAB1 polypeptide first. The transforming composed can be used in drugs for circulations e.g. as TGF-beta signal transmission inhibitors or circulators, or extracellular matrix production enhancement composed can be used in drugs for composed carrivators, or call proliferation prevention inhibitors or composed endigation inhibitors or activators, or composed endigation inhibitors or activators, or memoryte migration inhibitors or activators, or minumosuppression inhibitors or activators, or amyloid beta protein composed precipitation inhibitors or activators, and such substances can also be contivity. The present sequence encodes TAK1-6xHis from an example of the TAK1 polypeptide function, particularly kinase can contivity. The present sequence encodes TAK1-6xHis from an example of

The DNA is used to produce the TAK-1 protein which is involved in the TGF-beta family signal transmission system. TAK-1, also known as activator of MAPK Kinase (AMK-1), is an enzyme which is activated by TGF-beta and bone morphogenetic protein (BMP) and activates MAPK kinase by phosphorylation.

The method comprises: (a) contacting the polypeptide in the presence of a sample; and (b) detecting the amount of bound polypeptide, in which the sample can be pre-mixed with Taki or Tabl polypeptide first. The transforming growth factor (Tabl) beta inhibitory substances can be used in drugs for indications e.g. as Table polypeptide first. The transforming carbivators, or extracellular matrix protein production enhancement carbivators, or extracellular matrix protein production enhancement inhibitors or activators, or cell proliferation prevention inhibitors or cativators, or composite migration inhibitors or activators, or monocyte migration inhibitors or activators, or munosuppression inhibitors or activators, or amploid beta protein cativators inhibitors or activators, or amyloid beta protein cativators or inhibitors of the Taki polypeptide function, particularly kinase cativity. The present sequence encodes human Taki.

The present invention describes a method for screening compounds for inhibition of inflammatory cytokine signal transduction by contacting the sample with TAK1 and its receptor TAB1 and selecting for inhibition of TAK1/TAB1 binding. Also described is a method for screening compounds for inhibition of inflammatory cytokine signal transduction in which the inhibition of TAK1 phosphorylation is selected for; and drug compositions for the treatment of inflammatory disorders containing as active component an inflammatory cytokine signal transduction inhibitor. TAK1 is an essential component of the signalling process which results in release of inflammatory cytokine such as interleukin-1 (IL-1). Il-10, tumour necrosis factor (TAF) and IL-6. The methods can be used for the selection of effective antiinflammatory agents. The present
                                                                                                                                                                                                   1802

```
The invention relates to identifying pain-regulating substances (A) comprises (i) incubating a test substance with a cell (or preparation from it) that has synthesised a peptide or protein (B) and (ii) measuring either binding of the test substance to (B) or some functional parameter that is altered by this binding. The method is useful for identifying pain-regulating substances (A) with analgesic activity. (A) along with nucleic acid (ABL88411-ABL88441) that encode proteins (B), nationally containing the nucleic acid; antibodies against (B); cells that express (B) and agents that bind to (B), are all useful for treating pain, particularly chronic pain, including use in gene therapy. The same materials can also be used for diagnosis, e.g. of neurological and neurodegenerative diseases. The present sequence is that of a polynucleotide of the invention.
                                                                                                                                                                                                                                               Identifying pain-regulating compounds, useful for treating chronic pain and for diagnosis, by measuring binding of compounds to specific peptides and proteins
                                                                                                                                                           Schaefer MK;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     1663
                                                                              The invention provides a method for identifying or screening a nuclear factor kappa B (NF-kB) activation inhibitor by examining the effect of a test substance on modulating the function(s) of TGF-beta activated kinase I (TAK1). The NFkB activation inhibitors targeting on TAK1 can be used to treat or prevent autoimmune diseases (e.g. chronic rheumatoid arthritis), intractable diseases with inflammation (such as atrophic dermatitis and psoriasis), viral infection, endotoxin shock, septicemia and others. The present sequence represents the nucleotide sequence of human TAK1a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Nuclear factor kappa B; NF-kB; inhibitor; TGF-beta activated kinase 1; TAK1; autoimmune disease; chronic rheumatoid arthritis; inflammation; intractable disease; atrophic dermatitis; psoriasis; viral infection;

                                                                                                                                                                                                                                                                                                                          The present sequence encodes mouse transforming growth factor-beta (TGF-beta) activated kinase, TAK-1. The DNA is used to produce the TAK-1 procean which is involved in the TGF-beta family signal transmission system. TAK-1, also known as activator of MAPK Kinase (AMK-1), is an enzyme which is activated by TGF-beta and bone morphogenetic protein (BMP) and activates MAPK kinase by

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        밁
                            The invention provides a method for identifying or screening a nuclear factor kappa B (NF-kB) activation inhibitor by examining the effect of a test substance on modulating the function(s) of TGF-beta activated kinase I (TAKI). The NFkB activation inhibitors targeting on TAKI can be used to treat or prevent autoimmune diseases (e.g. chronic rheumatoid arthritis), intractable diseases with inflammation (such as atrophic dermatitis and psoriasis), viral infection, endotoxin shock, septicemia and others. The present sequence represents the nucleotide sequence of human TAKIb
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          1777

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention provides a method for identifying or screening a nuclear factor kappa B (NF-kB) activation inhibitor by examining the effect of a test substance on modulating the function(s) of TGF-beta activated kinase I (TAKI). The NFkB activation inhibitors targeting on TAKI can be used to treat or prevent autoimmune diseases (e.g. chronic rheumatoid arthritis), intractable diseases with inflammation (such as atrophic dermatitis and psoriasis), viral infection, endotoxin shock, septicemia and others. The present sequence represents the nucleotide sequence of human TAKIC
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Nuclear factor kappa for, e.g. autoimmune

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  detection reagent for detecting 1000 or more for elucidating cell signalling and cell-cell
                                                                                                                                                                                      1563

                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The inventueseful in developmental biology and in elucidating cell signalling cell-cell interactions in higher eukaryottes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New isolated nucleic a genes from Drosophila interactions -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Drosophila; developmental pharmaceutical; gene; ss.

The present invention describes a method (M1) for screening for an anti-neoplastic agent. The method involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, determining a change in expression of at least one gene (I) of a signature gene set, where (I) comprises a sequence (S) selected from 847 sequences (given in ABL61664 to ABL70110), or is at least 95% identical to (S), where a change in expression is indicative of anti-neoplastic activity. (I) has cytostatic expression is indicative of anti-neoplastic activity. (I) has cytostatic an anti-neoplastic agent, and can be used for producing a product which is the data collected with respect to the anti-neoplastic agent as a cresult of M1, and the data is sufficient to convey the chemical structure and/or properties of the agent. M1 can be used in the treatment of cancer such as colon, breast, stomach, lung, thyroid, adenocarcinoma, carcinoma, clear cell tearcinoma, neuroendocrine infiltrating lobular cancer, squamous cell carcinoma, neuroendocrine carcinoma, papillary carcinoma and Wilm's tumour.
                 Screening for anti-neoplastic agent involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, and determining a change in expression of a gene of a signature gene set

CSAPK polypeptides are involved in signalling pathways associated with cell growth and differentiation. The CSAPK polypeptides and polynucleotides are used to screen for agents that specifically modulate CSAPK, which are potential thrappeutic agents. They are also used for discrete which are potential thrappeutic agents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Claim 1;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence encodes a human regulator of intracellular phosphorylation (HRIP). HRIP is useful for screening agonists and antagonists of HRIP polypoptide. HRIP and its agonist or antagonist can are useful for treating a disease or condition associated with decreased or increased expression of functional HRIP. Diseases treated or diagnosed include neurological disorders such as stroke, Parkinson's criseases, demyelinating diseases, bacterial and viral meningitis and other developmental disorders of the central nervous system, neuromuscular disorders, myasthemia gravis, cell proliferative disorders including lenkaemia, melanoma, myeloma and cancer of the adrenal gland, bladder, bone, bone marrow, liver, lung, muscle, ovary, autoimmune/ inflammatory disorder such as Addison's disease, acquired immunodeficiency diseases, allergies, bronchitis, diabetes mellitus, rheumatoid arthritis, microbial infection and trauma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel human intracellular phosphorylation regulator polypeptides and polynucleotides for diagnosis, prevention and treatment of neurological, cell proliferative and autoimmune/inflammatory disorders
